

Java Full Stack Internship – Task 2

Task Description

In Task-1, you made a landing page and connected it with Spring Boot to print form data. Now, we will **store the submitted form data inside a database (MySQL)**. This step will help you understand how **real websites collect and store user information**, like contact details or feedback forms.

What You'll Build (Requirements)

1. Frontend:

- Same contact form (Name, Email, Message).

2. Backend (Spring Boot):

- Connect Spring Boot with MySQL using **Spring Data JPA**.
- Store submitted data into a **contacts** table.
- Provide an endpoint **/contacts** that shows all stored data in JSON

Why This Task Is Important

- You'll learn how data flows from frontend → backend → database.
- You'll practice with **Spring Data JPA**, which is widely used in Java projects.
- This forms the base of any **real-world web application**.

Deliverable

A **working contact form that saves** form submissions into a database.

Sample Starter Code

Contact Entity

java

```
@Entity
public class Contact {
    @Id
    @GeneratedValue(strategy = GenerationType.IDENTITY)
    private Long id;
    private String name;
    private String email;
    private String message;

    // getters & setters
}
```

Repository

java

```
public interface ContactRepository extends JpaRepository<Contact, Long> {}
```

Controller

```
java

@RestController
public class ContactController {
    @Autowired
    private ContactRepository repo;

    @PostMapping("/submit")
    public Contact saveContact(@RequestBody Contact contact) {
        return repo.save(contact);
    }

    @GetMapping("/contacts")
    public List<Contact> getAllContacts() {
        return repo.findAll();
    }
}
```
